- 14 Questions and answers on sodium laurilsulfate in the
- <sup>15</sup> context of the revision of the guideline on 'Excipients in
- the label and package leaflet of medicinal products for
- <sup>17</sup> human use' (CPMP/463/00 Rev.1)

### 18 **1. Background**

- 19 Following the European Commission decision to revise the Annex of the guideline on 'Excipients in the
- 20 label and package leaflet of medicinal products for human use' (CPMP/463/00 Rev. 1) [1], a
- 21 multidisciplinary group of experts involving SWP (lead), QWP, PDCO, PRAC (ex PVWP), CMD(h), VWP,
- 22 BWP and BPWP was created in 2011.
- 23 The objective of this group is to update the labelling of selected excipients listed in the Annex of the
- 24 above mentioned EC guideline, as well as to add new excipients to the list, based on a review of their
- safety. The main safety aspects to be addressed were summarised in a concept paper published in
- 26 March 2012 [2].
- 27 Draft questions and answers (Q&A) documents on excipients are progressively released for public
- consultation. They include proposals for new or updated information for the label and package leaflet.
- 29 The corresponding background report supporting the review is published for information only.
- 30 When one or several Q&As have been finalised, the new information in the package leaflet will be
- 31 included in a revised annex of the guideline.
- 32 For more information see the <u>Excipients labelling webpage</u> on the EMA website.

# 2. What is sodium laurilsulfate and why is it used as an excipient?

- 35 Sodium laurilsulfate (SLS), also known as sodium dodecyl sulfate, sodium lauryl sulfate or E487, is an
- organic compound with the formula  $CH_3(CH_2)_{11}OSO_3Na$ . SLS occurs as white or cream to pale yellow-
- coloured crystals, flakes, or powder having a smooth feel, a soapy, bitter taste, and a faint odour of
- fatty substances. The salt exhibits a neutral to alkaline pH (7.0–9.5 for a 1%  $^{w}/_{v}$  aqueous solution)
- 39 depending upon its chemical purity.
- 40 In medicinal products, SLS has a number of functional uses as an emulsifying agent, modified-release
- 41 agent, penetration enhancer, solubilising agent, tablet and capsule lubricant. It is not recommended
- 42 for the parenteral route of administration. Authorised medical products contain SLS ranging from
- 43 0.15% (e.g. creams) to 25% (medicated shampoos).
- 44 Being derived from inexpensive coconut and palm oils, SLS is a common component of many domestic
- 45 cleaning products such as hand soaps, washing-up liquid etc. Sodium coco-sulfate is essentially the
  46 same compound, but made from less purified coconut oil.
- 47 A related surfactant, Sodium Laureth Sulfate is more widely used as a detergent and surfactant in
- personal care products. It differs from SLS due to the presence of ethoxyl groups  $[(OCH_2CH_2)_n]$  in the
- 49 backbone where n=3 or more, which is thought to give it extra foaming activity. Sodium Laureth
- 50 Sulfate is not the subject of this review.

- 51 The cosmetic sector not only avoids the use of SLS in their products due to its skin-irritating properties
- 52 but actually uses it as a test reagent in human volunteers to deliberately induce skin reactions in the
- 53 testing of new cosmetic formulations
- 54 SLS is not a permitted food additive in the European Union.

### 55 3. Which medicinal products contain sodium laurilsulfate?

56 SLS is used in a wide variety of dosage forms dosage forms, for example as a wetting agent in oral 57 liquids and toothpastes and as an emulsifying agent in topical dosage forms such as creams, ointments 58 and medicated shampoos. The vast majority of dosage forms using SLS as an excipient are tablets and 59 capsules where it is used as a lubricant and/or releasing agent. As there are no reported adverse 60 reactions to SLS when used as excipient in tablets and capsules, the scope of the safety assessment is 61 limited to medicinal products applied to the skin or the scalp, such as creams, ointments, gels and 62 shampoos, which contain SLS.

#### 4. What are the safety concerns?

Reported adverse reactions to SLS in pharmaceutical formulations are skin irritation following topical
application [3, 4]. The skin irritancy is thought to be due its surfactant properties, producing disruption
of cell membranes and conformational changes of proteins.

- 67 A large number of publications attest to the skin damaging properties of SLS applied on its own;
- 68 however, case studies on formulated products are rare. The skin effects are more pronounced in
- 69 patients with eczematous conditions [5]. When used in cleaning products designed to be washed off
- 70 quickly, such as shampoos and soap, SLS rarely displays any adverse events.
- A safety review by the MHRA in 2013 on emollients containing SLS (0.9%) in topical medicinal
- 72 products concluded that such products may cause local skin reactions, such as stinging, burning,
- 73 itching, and redness, when used as a leave-on emollient, particularly in children with atopic
- eczema [6]. Reactions were likely be exacerbated by the presence of excipients with known effects on
- the skin such as benzoic acid/benzoates, bronopol, cetostearyl alcohol, chlorocresol,
- 76 parahydroxybenzoates and lanolin commonly found in topical preparations where SLS is also present.
- 77 The skin irritating property of SLS is made use of in the cosmetics industry to deliberately induce a
- skin a reaction as a comparative test reagent (positive control) in the development of semi-solid
- topical consumer products e.g. moisturisers, anti-ageing creams [7].

# So 5. What are the reasons for updating the information in the package leaflet?

- There is currently no EU regulatory guideline or recommendation in place relating to the acceptable levels of SLS in medicinal products.
- 84 Skin sensitivity to SLS varies according to the concentration of SLS, contact time, patient population
- 85 and experimental approaches. Furthermore, attempts to elucidate the skin irritation threshold in
- 86 humans is found to be dependent upon the site of the application, the vehicle in which SLS is dissolved,
- 87 the method of application, duration and frequency of application, the duration of the study, the
- presence of other skin-irritating excipients and whether the application is under occlusion [8].

- 89 Recommending a threshold for SLS in topical products is difficult to establish given the range of
- 90 confounding factors. However, it is a known skin irritant and is used as a positive (irritant) control in
- 91 the cosmetic industry. It is, therefore, proposed to have a threshold of 0% for SLS in topical medicinal
- 92 products for all age groups.

Name	Route of Administration	Threshold*	Information for the Package Leaflet	Comments
Sodium laurilsulfate or E487	Cutaneous	Zero	<ul> <li>This product contains sodium laurilsulfate x% w/w.</li> <li>Sodium laurilsulfate may cause local skin reactions (such as stinging or burning sensation) in particular if you have sensitive skin.</li> <li>May increase local reactions caused by other medicines when applied to the skin in the same area.</li> </ul>	The thickness of the skin varies considerably according to the body site and with age and can be an important factor in the sensitivity to sodium laurilsulfate (SLS). Sensitivity to SLS will also vary according the type of formulation (and effects of other excipients), the concentration of SLS, contact time and patient population (children, hydration level, skin color and disease). Patient populations with decreased skin barrier functions such as in atopic dermatitis are more sensitive to the irritant properties of SLS. Application of SLS can potentiate skin irritation caused by other medicines applied to the same area.

## 93 6. Proposal for new information in the package leaflet

94

95 Note:

96 \* The threshold is a value, equal to or above which it is necessary to provide the information stated for the package leaflet. This threshold is not a highest acceptable limit. A

97 threshold of 'zero' means that it is necessary to state the information in all cases where the excipient is present in the medicinal product [1].

Questions and answers on sodium laurilsulfate in the context of the revision of the guideline on 'Excipients in the label and package leaflet of medicinal products for human use' (CPMP/463/00 Rev.1) EMA/CHMP/606830/2014
